ALGORITHM & FLOWCHART MANUAL

ALGORITHM:

The word "algorithm" relates to the name of the mathematician Al-khowarizmi, which means a procedure or a technique. Software Engineer commonly uses an algorithm for planning and solving the problems. An algorithm is a sequence of steps to solve a particular problem or algorithm is an ordered set of unambiguous steps that produces a result and terminates in a finite time

Algorithm has the following characteristics

- Input: An algorithm may or may not require input
- **Output:** Each algorithm is expected to produce at least one result
- **Definiteness**: Each instruction must be clear and unambiguous.
- **Finiteness**: If the instructions of an algorithm are executed, the algorithm should terminate after finite number of steps

The algorithm and flowchart include following three types of control structures.

- 1. **Sequence**: In the sequence structure, statements are placed one after the other and the execution takes place starting from up to down.
- 2. **Branching (Selection):** In branch control, there is a condition and according to a condition, a decision of either TRUE or FALSE is achieved. In the case of TRUE, one of the two branches is explored; but in the case of FALSE condition, the other alternative is taken. Generally, the 'IF-THEN' is used to represent branch control.
- 3. Loop (Repetition): The Loop or Repetition allows a statement(s) to be executed repeatedly based on certain loop condition e.g. WHILE, FOR loops.

Advantages of algorithm

- It is a step-wise representation of a solution to a given problem, which makes it easy to understand.
- An algorithm uses a definite procedure.
- It is not dependent on any programming language, so it is easy to understand for anyone even without programming knowledge.
- Every step in an algorithm has its own logical sequence so it is easy to debug.

HOW TO WRITE ALGORITHMS

Step 1 **Define your algorithms input**: Many algorithms take in data to be processed, e.g. to calculate the area of rectangle input may be the rectangle height and rectangle width.

Step 2 **Define the variables**: Algorithm's variables allow you to use it for more than one place. We can define two variables for rectangle height and rectangle width as HEIGHT and WIDTH (or H & W). We should use meaningful variable name e.g. instead of using H & W use HEIGHT and WIDTH as variable name.

Step 3 **Outline the algorithm's operations:** Use input variable for computation purpose, e.g. to find area of rectangle multiply the HEIGHT and WIDTH variable and store the value in new variable (say) AREA. An algorithm's operations can take the form of multiple steps and even branch, depending on the value of the input variables.

Step 4 **Output the results of your algorithm's operations**: In case of area of rectangle output will be the value stored in variable AREA. if the input variables described a rectangle with a HEIGHT of 2 and a WIDTH of 3, the algorithm would output the value of 6.

FLOWCHART:

The first design of flowchart goes back to 1945 which was designed by John Von Neumann. Unlike an algorithm, Flowchart uses different symbols to design a solution to a problem. It is another commonly used programming tool. By looking at a Flowchartone can understand the operations and sequence of operations performed in a system. Flowchart is often considered as a blueprint of a design used for solving a specific problem.

Advantages of flowchart:

- Flowchart is an excellent way of communicating the logic of a program.
- Easy and efficient to analyze problem using flowchart.
- During program development cycle, the flowchart plays the role of a blueprint, which makes program development process easier.
- After successful development of a program, it needs continuous timely maintenance during the course of its operation. The flowchart makes program or system maintenance easier.
- It is easy to convert the flowchart into any programming language code.

Algorithm & Flowchart Manual

Flowchart is diagrammatic /Graphical representation of sequence of steps to solve a problem. To draw a flowchart following standard symbols are use

Symbol Name	Symbol	function
Oval		Used to represent start and end of flowchart
Parallelogram		Used for input and output operation
Rectangle		Processing: Used for arithmetic operations and data-manipulations
Diamond		Decision making. Used to represent the operation in which there are two/three alternatives, true and false etc
Arrows	$\longleftarrow \uparrow \longrightarrow$	Flow line Used to indicate the flow of logic by connecting symbols
Circle	\bigcirc	Page Connector

The language used to write algorithm is simple and similar to day-to-day life language. The variable names are used to store the values. The value store in variable can change in the solution steps. In addition some special symbols are used as below **Assignment Symbol** (\leftarrow or =) is used to assign value to the variable.

e.g. to assign value 5 to the variable HEIGHT, statement is

HEIGHT
$$\leftarrow 5$$

or
HEIGHT = 5

The symbol '=' is used in most of the programming language as an assignment symbol, the same has been used in all the algorithms and flowcharts in the manual.

Algorithm & Flowchart Manual

The statement C = A + B means that add the value stored in variable A and variable B then assign/store the value in variable C.

The statement R = R + 1 means that add I to the value stored in variable R and then assign/store the new value in variable R, in other words increase the value of variable R by 1

Mathematical Operators:

Operator	Meaning	Example
+	Addition	A + B
-	Subtraction	A – B
*	Multiplication	A * B
1	Division	A/B
٨	Power	A ³ for A ³
%	Reminder	A % B

Relational Operators

Operator	Meaning	Example
<	Less than	A < B
<=	Less than or equal to	A <= B
= or ==	Equal to	A = B
# or !=	Not equal to	A # B or A !=B
>	Greater than	A > B
>=	Greater tha or equal to	A >= B

Logical Operators

Operator	Example	Meaning
AND	A < B AND B < C	Result is True if both A <b and<="" td="">
		B <c are="" else="" false<="" td="" true=""></c>
OR	A< B OR B < C	Result is True if either A <b or<="" td="">
		B <c are="" else="" false<="" td="" true=""></c>
NOT	NOT (A >B)	Result is True if A>B is false
		else true

Selection Control	Example	Meaning
IF (Condition) Then ENDIF	IF (X > 10) THEN Y=Y+5 ENDIF	If condition X>10 is True execute the statement between THEN and ENDIF
IF (Condition) Then	IF (X > 10)THEN Y=Y+5	If condition X>10 is True execute the statement
ELSE	ELSE	between THEN and ELSE
	Y=Y+8	otherwise execute the
	Z=Z+3	statements between ELSE
ENDIF	ENDIF	and ENDIF

Selection control Statements

Loop control Statements

Selection Control	Example	Meaning
WHILE (Condition) DO ENDDO	WHILE (X < 10) DO print x x=x+1 ENDDO	Execute the loop as long as the condition is TRUE
DO UNTILL (Condition)	DO print x x=x+1 UNTILL (X >10)	Execute the loop as long as the condition is false

GO TO statement also called unconditional transfer of control statement is used to transfer control of execution to another step/statement. . e.g. the statement GOTO n will transfer control to step/statement n.

Note: We can use keyword INPUT or READ or GET to accept input(s) /value(s) and Keywords PRINT or WRITE or DISPLAY to output the result(s).

PROGRAMMING CONSTRUCTS

There are three types of programming constructs that provide protocols to help us in creating a flowchart.

1. SEQUENCE CONSTRUCT :

A sequence construct tells the processors which statement is to be executed next. In a sequence construct the program flow lines simply move from one statement to the next

EXAMPLE:- DEVELOP an algorithm and the flow chart to add two numbers

2. DECISION CONSTRUCT

IN a decision construct the program control will be transferred one statement to another depending upon whether the certain condition is met.

EXAMPLE:- DEVELOP an algorithm and flowchart to find the greater number between the two numbers

3. REPETION CONSTRUCT

IN repetition construct the statement is executed again and again till the given condition is met .it makes the use of loops .a loop is used to repeat a set of statements again and again till the given condition is met. A counter keyword is used to keep track of the loop

EXAMPLE:- Develop an algorithm and a flowchart to find the sum of 5 nos. taken from the user.

Algorithm & Flowchart Manual Algorithm & Flowchart to find the sum of two numbers

Algorithm

- Step-1 Start
- Step-2 Input first numbers say A
- Step-3 Input second number say B
- Step-4 SUM = A + B
- Step-5 Display SUM
- Step-6 Stop

OR

Algorithm

- Step-1 Start
- Step-2 Input two numbers say A & B
- Step-3 SUM = A + B
- Step-4 Display SUM
- Step-5 Stop

Algorithm & Flowchart to convert temperature from Celsius to Fahrenheit

Algorithm & Flowchart to convert temperature from Fahrenheit to Celsius

- C: temperature in Celsius
- F: temperature Fahrenheit

Algorithm

••

- Step-1 Start
- Step-2 Input temperature in Fahrenheit say F
- Step-3 C = 5.0/9.0 (F 32)
- Step-4 Display Temperature in Celsius C
- Step-5 Stop

Algorithm & Flowchart to Algorithm & Flowchart to find Area and Perimeter of Square

L : Side Length of Square AREA : Area of Square PERIMETER : Perimeter of Square

Algorithm

••

- Step-1 Start
- Step-2 Input Side Length of Square say L
- Step-3 Area = $L \times L$
- Step-4 PERIMETER = 4 x L
- Step-5 Display AREA, PERIMETER
- Step-6 Stop

Algorithm & Flowchart to find Area and Perimeter of Rectangle

L : Length of Rectangle B : Breadth of Rectangle AREA : Area of Rectangle PERIMETER : Perimeter of Rectangle

Algorithm

- Step-1 Start
- Step-2 Input Side Length & Breadth say L, B
- Step-3 Area = L x B
- Step-4 PERIMETER = 2 x (L + B)
- Step-5 Display AREA, PERIMETER
- Step-6 Stop

find Area and Perimeter of Circle

Algorithm & Flowchart to find Area & Perimeter of Triangle

(when three sides are given)

A : First Side of Triangle B : Second Side of Triangle C : Third Side of Triangle AREA : Area of Triangle PERIMETER : Perimeter of Triangle

Algorithm

••

- Step-1 Start
- Step-2 Input Sides of Triangle A,B,C
- Step-3 S= (A + B + C)/ 2.0
- Step-4 AREA = SQRT(S x (S-A) x (S-B) x(S-C))
- Step-5 PERIMETER = S1 + S2 + S3
- Step-6 Display AREA, PERIMETER
- Step-7 Stop

Algorithm & Flowchart to find Simple Interest

- P: Principle Amount
- N : Time in Years
- R: % Annual Rate of Interest
- SI : Simple Interest

Algorithm

•••

- Step-1 Start
- Step-2 Input value of P, N, R
- Step-3 $SI = (P \times N \times R)/100.0$
- Step-4 Display SI F
- Step-6 Stop

Algorithm & Flowchart to find Compound Interest

- P: Principle Amount
- N : Time in Years
- R: % Annual Rate of Interest
- CI : Compound Interest

Algorithm

- Step-1 Start
- Step-2 Input value of P, N, R C
- Step-3 $CI = P(1+R/100)^{N} P$
- Step-4 Display Cl
- Step-6 Stop

Swap Two Numbers using Temporary Variable

Algorithm

•••

••

- Step-1 Start
- Step-2 Input Two Numbers Say NUM1,NUM2
- Step-3 Display Before Swap Values NUM1, NUM2
- Step-4 TEMP = NUM1
- Step-5 NUM1 = NUM2
- Step-6 NUM2 = NUM1
- Step-7 Display After Swap Values NUM1,NUM
- Step-8 Stop

Algorithm & Flowchart to Swap Two Numbers without using temporary variable

Algorithm

- Step-1 Start
- Step-2 Input Two Numbers Say A,B
- Step-3 Display Before Swap Values A, B
- Step-4 A = A + B
- Step-5 B = A B
- Step-6 A = A B
- Step-7 Display After Swap Values A, B
- Step-8 Stop

Algorithm & Flowchart to find the smallest of two numbers

Algorithm & Flowchart to find the largest of two numbers

find the largest of three numbers

Algorithm

••

- Step-1 Start
- Step-2 Read three numbers say num1,num2, num3
- Step-3 if num1>num2 then go to step-5
- Step-4 IF num2>num3 THEN print num2 is largest

ELSE

print num3 is largest ENDIF

GO TO Step-6

Step-5 IF num1>num3 THEN print num1 is largest

ELSE

print num3 is largest

ENDIF

Step-6 Stop

••

find Even number between 1 to 50

Algorithm & Flowchart to find Odd numbers between 1 to n where n is a positive Integer

Algorithm & Flowchart to find sum of series 1+2+3+.....+N

Algorithm

••

- Step-1 Start
- Step-2 Input Value of N
- Step-3 I = 1, SUM=0
- Step-4 IF (I >N) THEN GO TO Step-8 ENDIF
- Step-5 SUM = SUM + I
- Step-6 I = I + 1
- Step-7 Go to step-4
- Step-8 Display value of SUM
- Step-9 Stop

Algorithm & Flowchart to find sum of series	1+3+5++N, Where N is positive
odd Integer	
Algorithm	

Algorithm

..

- Step-1 Start
- Step-2 Input Value of N
- Step-3 I = 1, SUM=0
- Step-4 IF (I >N) THEN GO TO step 8 ENDIF
- Step-5 SUM = SUM + I
- Step-6 I = I + 2
- Step-7 Go to step-4
- Step-8 Display value of SUM
- Step-9 Stop

Algorithm & Flowchart Manual find sum of series $1 - X + X^2 - X^3 \dots X^N$

Algorithm & Flowchart to print multiplication Table of a number

Algori	ithm	Stari
Step-1	Start	
Step-2	Input Value of NUM	Input Value of NUM
Step-3	I = 1	<u>/</u> /
